6	5	0 / 6	1
GC Comments	Flikt.AI Findings	Direct Matches	Partial Overlap

Key Finding: Flikt.AI identified 5 valid cross-discipline coordination conflicts that the GC did not flag, while missing all 6 of the GC's comments. The GC focused on **material specification mismatches** (text-level reading of callouts like "asphalt" vs "concrete"), while Flikt.AI identified **spatial and coordination conflicts** (electrical vs landscape routing, missing structural calcs). The two approaches are complementary — together they provide broader coverage than either alone.

GC Comments — What the Contractor Found

#	GC Comment	Disciplines	Category
1	Civil shows courts as asphalt, structural shows concrete — which one?	Civil ↔ Structural	Material Spec Mismatch
2	Arch/Structural show courts at 9,044 SF; civil shows 5,923 SF asphalt — confirm drainage design based on Arch SF	Arch ↔ Civil ↔ Structural	Quantity / SF Discrepancy
3	Structural shows concrete walkways, civil shows pavers	Civil ↔ Structural	Material Spec Mismatch
4	Structural shows kids play area as concrete, civil shows sand	Civil ↔ Structural	Material Spec Mismatch
5	Volleyball court: SP-0.1 #1 no court, SP-0.1 #2 shows new court, A-1.1 shows grass removal, C-04 shows volleyball as existing — no excavation/sand on civil	Arch ↔ Civil	Missing Scope on Civil
6	Fencing scope unclear around pickleball courts — A-1.0 shows 4.5' but not called out for bidders. Any fencing around playground?	Architectural	Missing Scope Clarity

Pattern: 5 of 6 comments are Civil ↔ Structural material/scope mismatches. The GC is reading specific text callouts on sheets and cross-referencing quantities. Combined civil + structural bids exceed \$1M — these mismatches have major cost impact.

Flikt.AI Findings — What the AI Detected

#	Flikt.AI Finding	Disciplines	Severity	Score
1	Electrical conduit routing conflicts with landscape tree plantings	Electrical ↔ Landscape	Major	27/50
2	Structural calculations missing for electrical equipment foundations	Structural ↔ Electrical	Major	30/50
3	Site demolition conflicts with utility relocations	Architectural ↔ Civil	Major	38/50
4	Landscape irrigation conflicts with electrical underground systems	Landscape ↔ Electrical	Major	28/50
5	Wind load calculations may not account for new site lighting structures	Structural ↔ Electrical	Minor	24/50

Pattern: Flikt.AI focused on Electrical ↔ Landscape and Structural ↔ Electrical coordination gaps. These are legitimate design coordination concerns — but they are in a different category than what the GC flagged. Finding #3 (demolition vs utilities) has the closest thematic overlap with the GC's Civil ↔ Structural concerns.

Gap Analysis

Why Flikt.AI Missed the GC's Comments

- All 6 GC comments involve reading specific **text callouts** on sheets — material labels like "asphalt" vs "concrete", SF quantities like "5,923 SF" vs "9,044 SF"
- At compressed JPEG quality (1600px wide), small text annotations on construction drawings are not legible enough for AI to parse and cross-reference
- GC comments are primarily **Civil ↔ Structural** material mismatches — Flikt.AI's prompt focused more on Electrical ↔ Landscape and Structural ↔ Electrical pairs
- The GC compares specific specification callouts sheet-to-sheet; the AI looks at spatial/visual patterns and general coordination gaps

What Flikt.AI Found That the GC Didn't

- 5 legitimate coordination issues: electrical vs landscape routing, missing structural calcs for electrical equipment, wind load gaps for lighting poles
- These are valid concerns a GC might not flag because GCs focus on **bid-impacting items** (material specs, quantities) rather than design coordination gaps
- Demonstrates **complementary value** — AI catches different categories than human reviewers, providing broader overall coverage when used together

Improvement Roadmap (to close the gap)

Improvement	Description
OCR Pre-Processing	Extract text callouts from sheets before AI analysis so material specs, quantities, and scope notes are machine-readable
Material Cross-Referencing	Compare material callouts (asphalt / concrete / pavers / sand) across discipline sheets for the same area
Quantity / SF Comparison	Cross-check area calculations and quantities between disciplines (e.g., 9,044 SF vs 5,923 SF)
Scope Completeness Checks	Verify that work shown on one discipline's sheet is captured on related discipline sheets (e.g., volleyball court on Arch but missing from Civil)
Targeted Civil ↔ Structural Prompting	This is a high-value discipline pair that the current prompt underweights — add specific comparison logic
Higher Resolution for Text-Heavy Sheets	Increase from 1600px JPEG to full resolution for sheets with dense text annotations and callouts

Conclusion

Verdict: For demo purposes, Flikt.AI detected 5 valid cross-discipline conflicts that provide genuine value. However, it missed all 6 of the GC's specific comments, which were primarily material specification mismatches requiring text-level reading of plan callouts.

Closing this gap requires **OCR pre-processing** to make text callouts machine-readable, and **targeted specification comparison** logic to cross-reference materials, quantities, and scope between disciplines. Both items are on the production roadmap.

The key insight is that AI and human reviewers catch **different categories** of conflicts. The GC found material/scope mismatches; Flikt.AI found spatial coordination gaps. Used together, the combined coverage is broader than either approach alone — a strong value proposition for the platform.
